

CRED

Designing the AI-Native Enterprise

From a bill-pay app to India’s household financial intelligence layer

INDUSTRY	USE CASE #1 (LIVE)	LIVE APPLICATION	TEAM
Fintech / BFSI — India	AI Household Card Router	dtai-fintech-cred.vercel.app	DTAI Fintech · PGP Capstone

One recommendation, already proven

CRED should extend from single-user bill-pay into household-level financial intelligence — starting with an AI card router that ends manual reward comparison for multi-card families. It is built, deployed, and answering real purchases today.

₹33,036

recovered per household / yr
by routing every purchase optimally

36

terms-and-conditions rules encoded
and priced deterministically, not by
the model

5×

demonstrated swing in reward value
from one phrase: “portal” vs “direct”
booking

Live

today — deployed, tested end to end,
not a mockup or a promise

Why the Board should approve this first

- Highest value × highest feasibility use case on the Opportunity Matrix (slide 7)
- Ships on CRED’s existing card-linkage data — no new regulatory data class required
- Deterministic pricing keeps AI risk contained to explanation, not decisioning

CRED today

A trust-first fintech platform built on top of India's premium credit card base.

CORE PRODUCT

Credit card bill payments with reward points, built for financially disciplined, high-trust members

ADJACENT PRODUCTS

CRED Cash (credit line), CRED Mint (peer lending), CRED Garage (vehicle), CRED Store (rewards marketplace)

POSITION

Premium, single-member experience — optimized for the individual cardholder, not the household

MONETIZATION TODAY

Card-issuance referral commissions, lending interest, merchant rewards partnerships

The gap: Indian financial decisions are made by households, not individuals — CRED's product is not.

India's fintech landscape is consolidating around data, not apps

1

UPI as the rail, cards as the margin

UPI carries transaction volume at near-zero take rate; card issuance and credit remain where fintechs earn

2

Account Aggregator adoption rising

RBI-licensed consent-based data sharing is live infrastructure — not yet a mainstream product surface

3

Embedded finance intensifying competition

Jupiter, INDmoney, Fi and neobanks are converging on the same wealth-and-rewards layer CRED occupies

4

Household, not individual, is under-served

No major Indian fintech product treats the family as the unit of financial decision-making

Where the business feels this — stated in business terms

Engagement plateaus after bill-pay	Once a bill is paid on time, the member has no reason to reopen the app until the next cycle
Monetization is single-product dependent	Revenue leans on card-issuance commissions; cross-sell into new products has been slow to compound
Members transact as a household, CRED sees one person	Spouses, parents and dependents hold separate cards CRED never links — losing the full wallet share
Trust is the brand, but advice is generic	CRED knows a member pays on time; it has no view into whether they are using the right card for a purchase

Seven decisions a household makes — where prediction and judgment help

Card routing

Which card earns most for this purchase, across every member

Protection gaps

Is life/health cover adequate given debt and dependents

Document intelligence

Extract policy fields, flag missing or outdated nominees

Cash-flow advisory

Can the household afford this, given committed obligations

Portfolio concentration

Is asset allocation reasonably diversified

Tax headroom

80C/80D utilisation and regime comparison

Shared bills

Split and track obligations across members transparently

Card Routing is prioritized first — see Opportunity Matrix, next slide.

Card Routing sits alone in Priority Initiatives

Why Card Routing wins

- Uses data CRED already has — linked cards, no new consent flow
- Deterministic pricing — lowest AI risk tier of all seven use cases
- Answer is useful the first time a household links a second card
- Directly measurable KPI: ₹ recovered per household per year

From a bill-pay app to the household's financial intelligence layer

“Every financial decision a family makes — which card, how much cover, what to file — should have a clear, explainable answer available before the decision is made, not after the statement arrives.”

1

Household, not individual

Every module reasons across linked members, not one cardholder

2

Explainable by construction

AI explains; deterministic code decides — every number is reproducible

3

Human confirms, human acts

The member sees what the model understood before anything is priced

Three strategic bets, sequenced by risk

1

Bet 1 — Prove judgment at low risk

Card Routing: recommendation only, no autonomous transaction, deterministic pricing. Live now.

2

Bet 2 — Extend to advisory categories

Protection, tax, portfolio: still advisory, still human-confirmed, broader household data.

3

Bet 3 — Earn the right to real data

Only after Bets 1–2 prove reliability does the roadmap justify Account Aggregator-linked live data.

The full strategy on one page

CUSTOMER Multi-card households — primary earner + linked family members	VALUE PROPOSITION Never leave reward value on the table; one household, one answer	DATA Linked card metadata, issuer T&Cs, purchase description (typed, not scraped)	AI CAPABILITY NL intake (Gemini) + deterministic rules engine (36 rules) + explanation layer
INTEGRATION In-app module; card-linkage flow CRED already operates today	USE CASES Card Router (live) → Protection, Tax, Vault, Portfolio, Payments (Phase 2–3)	GOVERNANCE Advisory-only risk tier; human confirms every parsed purchase before pricing	KPI ₹ rewards leakage recovered per household per year (₹33,036 demo baseline)

Seven modules, one household model

MODULE	PAIN POINT	AI CAPABILITY	PHASE
Card Router	Manual reward comparison across cards	NL intake + rules engine + explanation	P1 — live
Protection Score	Unclear if life/health cover is adequate	Gap analysis against income & dependents	P2
Family Vault	Nominee/estate gaps go unnoticed	Document extraction + legacy-flag detection	P2
Tax Compliance	Unclaimed 80C/80D headroom	Deduction gap + regime comparison	P2
Portfolio	No consolidated household allocation view	Concentration analysis, natural-language Q&A	P3
Cash-flow / Payments	Shared bills tracked manually	Affordability check, obligation splitting	P3

Watch the winner change with one phrase

SAME ₹80,000 FLIGHT

"...through SmartBuy"

HDFC Infinia Metal

₹13,200

16.5% — portal accelerator fires

"...direct with the airline"

Axis Atlas

₹4,000

5% — portal rule never applies

What the Board sees live

- Household manager types the purchase in plain English — no dropdown
- AI extracts amount, category, merchant, booking channel
- A deterministic rules engine — not the model — prices every card and picks the winner
- The explanation names the exact clause that decided it

Application Lead demos this live for 3–5 minutes here. Backup: screen-recorded run of the same scenario.

How teams, decisions and workflow change

Product	Owns the use case backlog against the Opportunity Matrix, not feature requests
AI/ML	Owns model selection, failover configuration, and explanation-quality review
Risk & Compliance	Owns the risk-tier classification and sign-off before any use case ships
Household member	Retains final action — confirms every AI reading before it is priced or acted on

Decision rights are deliberately narrow: the model never has authority to move money or finalize a recommendation without the confirm step.

Five layers, one accountable owner each

Strategy	Product	Which use case ships next, sequenced by the Opportunity Matrix
Data	Data Eng.	Card linkage, issuer T&Cs ingestion, consent (AA framework, future)
Model	AI/ML	Intake + explanation models, failover chain across models & keys
Application	Engineering	Deterministic rules engine, decision trace, UI confirm step
Governance	Risk & Compliance	Risk tiering, human-in-the-loop enforcement, audit trail

What the prototype uses today vs. what production needs

TODAY — PROTOTYPE

- Two synthetic households, compiled into the app — no external data source
- 36 card terms hand-encoded from published, public fee schedules
- Purchase details typed by the user — no transaction feed
- No PII collected; no persistent database on the deployed instance

PRODUCTION — REQUIRED

- Consented transaction & card data via the RBI Account Aggregator framework
- Issuer T&C ingestion pipeline with version tracking as terms change
- Card-on-file tokenisation for real spend routing, not typed description
- DPDP Act 2023-compliant retention and household-consent design

Prediction and decision are deliberately separate systems

Resilience, tested in production

- Model + key failover chain — a rate-limited model moves to the next automatically
- Per-attempt timeout so a hung model fails fast, not silently, mid-demo
- Deterministic fallback: if every model fails, rules-only pricing still answers

Cost to run

< ₹1

per recommendation
(2 short model calls)

₹0

marginal cost of the
pricing engine itself — pure code

Decision rights are narrow by design

What the model may do

- Read a purchase description
- Price cards using disclosed logic
- Explain a decision already made

What the model may never do

- Choose the winning card unilaterally
- Move money or initiate a transaction
- Skip the human confirmation step

Risk tier: Advisory / Recommendation — lowest tier on the Risk Governance Canvas (next slide is the risk matrix; the tier definition sits on slide 18).

Decision rights, risk tier, human-in-the-loop

DIMENSION	DESIGN CHOICE
Decision authority	Recommendation only. Final action always taken by the household member.
Risk tier	Advisory / Low — no funds movement, no regulated credit decision.
Human-in-the-loop point	Parsed purchase (amount, category, channel) shown for correction before pricing.
Explainability requirement	Every recommendation ships with a full rule-by-rule decision trace.
Escalation path	Ambiguous or all-excluded cases surface an honest “no good option”, never a guess.
Model failure handling	Falls back to deterministic rules-only pricing — recommendation never blocked.

Where value is created, beyond the recovered rupee

Direct member value

₹33,036/yr recovered per multi-card household — the headline, member-visible number

Engagement

A reason to reopen the app before the next bill — addresses the plateau on slide 5

Data asset

Every linked card and confirmed purchase deepens CRED's view of real household spend

Cross-sell surface

A household with visible reward leakage is a qualified lead for its next card

Illustrative sizing — stated assumptions, not disclosed figures

Illustrative · ₹33,036/household/yr × assumed reach. NOT sourced from CRED's disclosed financials — built bottom-up from the live app's demo household economics for this class exercise.

COST STRUCTURE

< ₹1

per recommendation served

₹0

incremental cost per rule or card added — pricing is code, not inference

TAKE-RATE LOGIC

CRED does not need to capture the recovered rupee directly — the mechanism is engagement and card-issuance referral, both existing revenue lines, applied to a stickier, more frequent product surface.

Named risks, with mitigations already built

Hallucinated pricing

Impossible by construction — the model never computes a rupee figure; code does

Provider rate limits mid-demo

Automatic failover across models and keys, tested live in production

Stale or wrong card terms

Terms sourced from published schedules; production requires a version-tracked ingestion pipeline

Bias toward well-documented cards

Unknown cards default to a conservative 1% base rate, flagged as low confidence

Likelihood × impact, application-specific risks

Mitigation status

- Hallucinated pricing: eliminated by design, not mitigated
- Rate-limit risk: multi-model failover live and tested
- Stale terms: flagged as a Phase 2 pipeline requirement
- Ambiguous intake: surfaced to the human, never guessed silently

Phased, and Phase 1 is already shipped

A household financial operating system, three to five years out

Every decision, explained

Card, cover, tax, and investment choices all carry a visible, auditable rationale

Real data, real consent

Account Aggregator-linked live feeds replace typed descriptions and synthetic households

CRED as the household layer

Not a bill-pay app with modules — the default surface a family opens to decide anything financial

What we are asking the Board to approve

1

Approve Card Router for member rollout

It is built, deployed, and tested — approval starts a rollout, not a build.

2

Fund Phase 2 advisory modules

Reuse the same architecture and risk tier; Protection, Vault and Tax are additive, not new risk.

3

Commission the Account Aggregator integration

The single dependency standing between this prototype and real household data.

A strategy without a working prototype is a proposal. This is not a proposal.
